

## The effect of transformations on specific points

Sometimes you will not be given the original function, but will be given a sketch with specific points and features you need to transform.

Where would each of these points end up?

$y = f(x)$	$(4, 3)$	$(1, 0)$	$(6, -4)$
$y = f(x + 1)$			
$y = f(2x)$			
$y = 3f(x)$			
$y = f(x) - 1$			
$y = f\left(\frac{x}{4}\right)$			
$y = f(-x)$			
$y = -f(x)$			

## Test Your Understanding

Figure 1 shows a sketch of the curve  $C$  with equation  $y = f(x)$ , where

$$f(x) = x^2(9 - 2x).$$

There is a minimum at the origin, a maximum at the point  $(3, 27)$  and  $C$  cuts the  $x$ -axis at the point  $A$ .

(a) Write down the coordinates of the point  $A$ .

(1)

(b) On separate diagrams sketch the curve with equation

(i)  $y = f(x + 3)$ ,

(ii)  $y = f(3x)$ .

On each sketch you should indicate clearly the coordinates of the maximum point and any points where the curves cross or meet the coordinate axes.

(6)

The curve with equation  $y = f(x) + k$ , where  $k$  is a constant, has a maximum point at  $(3, 10)$ .

(c) Write down the value of  $k$ .

(1)

a)

b)

c)
