

## Lower 6 Chapter 9

# Trig Ratios

### Chapter Overview

1. Sine/ Cosine Rule
2. Areas of Triangles
3. Trig Graphs
4. Proof of Sine/ Cosine Rule

<p>5 Trigonometry</p>	<p>5.1</p>	<p>Understand and use the definitions of sine, cosine and tangent for all arguments;</p> <p>the sine and cosine rules;</p> <p>the area of a triangle in the form <math>\frac{1}{2}ab \sin C</math></p>	<p>Use of <math>x</math> and <math>y</math> coordinates of points on the unit circle to give cosine and sine respectively,</p> <p>including the ambiguous case of the sine rule.</p>
	<p>5.3</p>	<p>Understand and use the sine, cosine and tangent functions; their graphs, symmetries and periodicity.</p>	<p>Knowledge of graphs of curves with equations such as <math>y = \sin x</math>, <math>y = \cos(x + 30^\circ)</math>, <math>y = \tan 2x</math> is expected.</p>

## Sine and Cosine Rule

### The Cosine Rule

<u>You have</u>	<u>You want</u>	<u>Use</u>
#1: Two angle-side opposite pairs	Missing angle or side in one pair	Sine rule
#2 Two sides known and a missing side opposite a known angle	Remaining side	Cosine rule
#3 All three sides	An angle	Cosine rule
#4 Two sides known and a missing side not opposite known angle	Remaining side	Sine rule twice

Examples:

1.

2.

3.

4. Coastguard station  $B$  is 8 km, on a bearing of  $060^\circ$ , from coastguard station  $A$ . A ship  $C$  is 4.8 km on a bearing of  $018^\circ$ , away from  $A$ . Calculate how far  $C$  is from  $B$ .

Test Your understanding

1.

2.

3.

Ex 9A Pg 177

## The Sine Rule

Examples:

1.

2.

3.

4.

### Extension

[MAT 2011 1E]

The circle in the diagram has centre  $C$ . Three angles  $\alpha$ ,  $\beta$ ,  $\gamma$  are also indicated.

The angles  $\alpha$ ,  $\beta$ ,  $\gamma$  are related by the equation:

- A)  $\cos \alpha = \sin(\beta + \gamma)$
- B)  $\sin \beta = \sin \alpha \sin \gamma$
- C)  $\sin \beta(1 - \cos \alpha) = \sin \gamma$
- D)  $\sin(\alpha + \beta) = \cos \gamma \sin \alpha$

## The Ambiguous Case

Example:

Given that the angle  $\theta$  is obtuse, determine  $\theta$  and hence determine the length of  $x$ .

## Area of Non Right-Angled Triangles

Test  
your

understanding:

1. The area of this triangle is 10. Determine  $x$ .

2. The area of this triangle is also 10. If  $\theta$  is obtuse, determine  $\theta$ .

## Problem solving with sin/cos rule

### Example

The diagram shows the locations of four mobile phone masts in a field,  $BC = 75 \text{ m}$ .  $CD = 80 \text{ m}$ , angle  $BCD = 55^\circ$  and angle  $ADC = 140^\circ$ .

In order that the masts do not interfere with each other, they must be at least 70m apart.

Given that  $A$  is the minimum distance from  $D$ , find:

- a) The distance  $A$  is from  $B$
- b) The angle  $BAD$
- c) The area enclosed by the four masts.

Using the sine rule twice:

Test  
your

understanding

1.

2.

## Extension

1. [AEA 2009 Q5a] The sides of the triangle  $ABC$  have lengths  $BC = a$ ,  $AC = b$  and  $AB = c$ , where  $a < b < c$ . The sizes of the angles  $A$ ,  $B$  and  $C$  form an arithmetic sequence.

(i) Show that the area of triangle  $ABC$  is  $ac \frac{\sqrt{3}}{4}$ .

Given that  $a = 2$  and  $\sin A = \frac{\sqrt{15}}{5}$ , find

- (ii) the value of  $b$ ,  
(iii) the value of  $c$ .

# Trig Graphs

$$Y = \sin x$$

$$Y = \cos x$$

$$Y = \tan x$$

## Using trig graphs

Suppose we know that  $\sin(30) = 0.5$ . By thinking about symmetry in the graph, how could we work out:

$\sin(150)$

$\sin(-30)$

$\sin(210)$

Suppose we know that  $\cos(60) = 0.5$ . By thinking about symmetry in the graph, how could we work out:

$\cos(120)$

$\cos(-60)$

$\cos(240)$

Suppose we know that  $\tan(30^\circ) = \frac{1}{\sqrt{3}}$ . By thinking about symmetry in the graph, how could we work out:

Tan(-30)

Tan(150)

4. Sketch  $y = \sin\left(\frac{x}{2}\right)$ ,  $0 \leq x \leq 360^\circ$

### Extension

1.

[MAT 2013 1B] The graph of  $y = \sin x$  is reflected first in the line  $x = \pi$  and then in the line  $y = 2$ . The resulting graph has equation:

- A)  $y = \cos x$
- B)  $y = 2 + \sin x$
- C)  $y = 4 + \sin x$
- D)  $y = 2 - \cos x$

2.

[MAT 2011 1D] What fraction of the interval  $0 \leq x \leq 360^\circ$  is one (or both) of the inequalities:

$$\sin x \geq \frac{1}{2}, \quad \sin 2x \geq \frac{1}{2} \quad \text{true?}$$

3.

*MAT 2007 1G*] On which of the axes is a sketch of the graph

$$y = 2^{-x} \sin^2(x^2)$$

(a)

(b)

(c)

(d)

## Proof of Cosine Rule

We want to use Pythagoras, so split  $c$  into two so that we get two right-angled triangles.

## Proof of Sine Rule

The idea is that we can use the common length of  $\triangle ACX$  and  $\triangle XBC$ , i.e.  $h$ , to connect the two triangles, and therefore connect their angles/length.
