## 4A Direct Collisions \& Newton's Law of Restitution

1. In these questions the diagrams show the speeds of two particles $A$ and $B$ just before and just after a collision. The particles are moving on a smooth horizontal plane.

Find the coefficient of restitution in each case.
a)

| Before impact | After impact |
| :---: | :---: |
| $\xrightarrow[(A)]{8} A+$ rest | $\underset{(A)}{\text { At rest }} \xrightarrow{2}$ |

b)

| Before impact |  | After impact |  |
| :---: | :---: | :---: | :---: |
| $\xrightarrow{6}$ | $\xrightarrow{3}$ | $\xrightarrow{4}$ |  |

c)

| Before impact | After impact |  |
| :---: | :---: | :---: |
| 117 | 6 | 3 |
| (A) (B) | (A) | (B) |

2. Find the value of $v$ in the situation shown, given that $e=1 / 3$
$\xrightarrow[\rightarrow|c|]{\text { Before impact }}$ After impact
3. Calculate the values of $v_{1}$ and $v_{2}$, given that the coefficient of restitution is $1 / 2$

| Befor | mpact | After impact |  |
| :---: | :---: | :---: | :---: |
| $\stackrel{5}{ }$ | 4 | $\xrightarrow{\mathrm{v}_{1}}$ | $\xrightarrow{\mathrm{V}_{2}}$ |
| (A) | (B) | (A) | (B) |
| 200g | 400 g | 200 g | 400g |

4. Two small spheres have mass 3 m and 4 m respectively. They are moving towards each other in opposite directions on a smooth horizontal plane. $P$ has speed $3 u$ and $Q$ has speed $2 u$ just before the impact. The coefficient of restitution between $P$ and $Q$ is e.
a) Show that the speed of $Q$ after the collisions is given by ${ }^{4} / 7(15 e+1)$
b) Given that the direction of motion of $P$ is unchanged, find the range of possible values for $e$
c) Given that the magnitude of the impulse of $P$ on $Q$ is ${ }^{80 \mathrm{mu}} / 9$, find the value of e

## 4B Direct Collisions with a Smooth Plane

Westie's key note: to find a new velocity after an impact with a wall, just multiply by e (note the final velocity will be in the opposite direction)

1. A particle collides normally with a fixed vertical plane.

The diagram shows the speeds (in $\mathrm{ms}^{-1}$ ) of the particle before and after collision. Find the value of the coefficient of restitution, e.

2. A small sphere collides normally with a fixed vertical wall. Before the impact, the sphere is moving with a speed of $4 \mathrm{~ms}^{-1}$ on a smooth horizontal floor. The coefficient of restitution between the sphere and the wall is 0.2 .

Find the speed of the sphere after the collision.
3. A particle falls 22.5 cm from rest onto a smooth horizontal plane. It then rebounds to a height of 10 cm .

Find the coefficient of restitution between the particle and the plane. Give your answer to $2 s f$.

## 4C Collisions \& Kinetic Energy

1. Two spheres have equal radii and masses 3 kg and 5 kg respectively. $A$ and $B$ move towards each other along the same straight line on a smooth horizontal surface with velocities $3 \mathrm{~ms}^{-1}$ and $2 \mathrm{~ms}^{-1}$ respectively.
a) If the coefficient of restitution is $3 / 5$, find the velocities of the spheres after the collision
b) Find the loss of kinetic energy due to the impact
2. A gun of mass 600 kg fires a shell of mass 12 kg horizontally, with velocity $20 \mathrm{~ms}^{-1}$.
a) Find the velocity of the gun after the shell has been fired
b) Find the total kinetic energy generated on firing
c) Show that the ratio of the energy of the gun to the energy of the shell is equal to the ratio of the speed of the gun to the speed of the shell
3. Two particles, $A$ and $B$, of mass 200 g and 300 g respectively, are connected by a light inextensible string. The particles are side-by-side on a smooth floor and $A$ is projected with speed $6 \mathrm{~ms}^{-1}$ away from $B$. When the string become taut, particle $B$ is jerked into motion and $A$ and $B$ then move a common speed in the direction of $A^{\prime}$ s original motion.

Find:
a) The common speed of the particles after the string becomes taut
b) The loss of kinetic energy as a result of the jerk

## 4D Successive Collisions

1. Three spheres $A, B$ and $C$ have masses $1 \mathrm{~kg}, 2 \mathrm{~kg}$ and 3 kg respectively. They are moving along the same straight horizontal plane with $A$ following $B$, which is following $C$. The initial velocities of $A, B$ and $C$ are $7 \mathrm{~ms}^{-1}, 3 \mathrm{~ms}^{-1}$ and $1 \mathrm{~ms}^{-1}$ in the direction $A B C$. Sphere $A$ collides with sphere $B$ then sphere $B$ collides with sphere $C$. The coefficient of restitution between $A$ and $B$ is $1 / 2$ and between $B$ and $C$ is $1 / 4$.
a) Find the velocities of the 3 spheres after both collisions have taken place
b) Explain how you know that there will be a further collision between $A$ and $B$
2. A uniform smooth sphere $P$ of mass $3 m$ is moving in a straight line with speed $u$ on a smooth horizontal table. Another uniform smooth sphere $Q$ of mass $m$ and having the same radius as $P$, is moving with speed 2 u in the opposite direction of $P$. $P$ and $Q$ collide directly, and their speeds after the collision are $v$ and $w$ respectively. The coefficient of restitution between $P$ and Q is e .
a) Find expressions for $v$ and $w$ in terms of $u$ and $e$.
b) Show that, if the direction of motion of $P$ is changed by the collision, then $e>1 / 3$

Following the collision with $P$, the sphere $Q$ then collides with and rebounds from a vertical wall. The coefficient of restitution between $Q$ and the wall is $e^{\prime}$
c) Given that $\mathrm{e}=5 / 9$ and that P and Q collide again in the subsequent motion, show that $e^{\prime}>1 / 9$
3. A tennis ball, which may be modelled as a particle, is dropped from rest at a height of 90 cm onto a smooth horizontal plane. The coefficient of restitution between the ball and the plane is 0.5 . Assume there is no air resistance and the ball falls freely under gravity at a right angle to the plane.
a) Find the height to which the ball rebounds after the first bounce
b) Find the height to which the ball bounces after the second bounce
c) Find the total distance travelled by the ball before it comes to rest
