(b) Alternative

M 1: Notes (or works out using scalar products) that $-\mathbf{j}+\mathbf{3 k}$ is a vector perpendicular to both $\mathbf{O A}=2 \mathbf{i}$ and $\mathbf{O B}=3 \mathbf{j}+\mathbf{k}$

(c)

M 1: Finds either 3 or 5 or both
A1: Expresses four of the six terms as powers of either generator correctly (may omit identity and generator itself)
A1: Expresses all six terms correctly in terms of either 3 or 5 (Do not need to give both)

| 10(a) | $P_{n-1}$ is the population at the end of year $n-1$ and this is increased by $10 \%$ by the end of year $n$, so is multiplied by $110 \%=1.1$ to give $1.1 \times P_{n-1}$ as new population by natural causes | B1 | 3.3 |
|  | Q is subtracted from $1.1 \times \mathrm{P}_{\mathrm{n}-1}$ as Q is the number of deer removed from the estate | B1 | 3.4 |
|  | So $P_{n}=1.1 P_{n-1}-Q, \quad P_{0}=5000$ as population at start is 5000 and $n \in Z^{+}$ | B1 | 1.1b |
|  |  | (3) |  |
| (b) | Let $n=0$, then $P_{0}=(5000-10 Q)(1.1)^{0}+10 Q=5000 \quad$ so result is true when $\mathrm{n}=0$ | B1 | 2.1 |
|  | Assume result is true for $n=k, P_{k}=(1.1)^{k}(5000-10 Q)+10 Q$, then as $P_{k+1}=1.1 P_{k}-Q$, so $P_{k+1}=\ldots$ | M1 | 2.4 |
|  | $P_{k+1}=1.1 \times 1.1^{\mathrm{k}}(5000-10 \mathrm{Q})+1.1 \times 10 \mathrm{Q}-\mathrm{Q}$ | A1 | 1.1b |
|  | So $P_{k+1}=(5000-10 Q)(1.1)^{k+1}+10 Q$, | A1 | 1.1b |
|  | Implies result holds for $\mathrm{n}=\mathrm{k}+1$ and so by induction $P_{n}=(5000-10 Q)(1.1)^{n}+10 Q, \quad$ is true for all integer $n$ | B1 | 2.2a |
|  |  | (5) |  |
| (c) | For $\mathrm{Q}<500$ the population of deer will grow, for $\mathrm{Q}>500$ the population of deer will fall | B1 | 3.4 |
|  | For $\mathrm{Q}=500$ the population of deer remains steady at 5000, | B1 | 3.4 |
|  |  | (2) |  |
